The Effect of Celebrity Endorsements on Brand Trust and Purchase Intention

Celebrity endorsement use has become an increasingly integral aspect of product marketing. Bergkvist and Colleagues (2016) noted that as many of 10% of magazine ads featured a celebrity endorsement, as well as the brand Nike contributing as much as $800 million per year on endorsements (p. 171). Due to this recent upward trend in celebrity endorsement use as a marketing tactic, it is essential to address just how these celebrity endorsements positively impact brands in their current market.

A key aspect of this research is testing for a possible association between celebrity endorsements and brand trust. Numerous previous studies have analyzed these factors in the context of digital marketing, providing important insights into formulating hypotheses. Chaudhuri and Holbrook (2001) define the concept of "brand trust" itself as an average consumer's ability to anticipate that a brand & its products will perform their stated functions (p. 82). The pair of researchers sought to examine the importance of a high level of brand trust in a brand's overall market performance. Their findings supported the claim that brand trust was significant in fostering brand loyalty. Researchers discussed that one of the greatest ways consumers measured personal brand trust was through name recognition of a brand, thus allowing more well-known brands to have more influence over performance metrics such as market share and relative pricing (Chaudhuri and Holbrook, 2001). Febrian and Faldy (2021) investigated the link between brand attitude (in which brand trust was included in the definition of brand attitude) and celebrity endorsement. Researchers' results supported a positive relationship between brand attitudes and celebrity endorsements. These findings support the idea that a celebrity endorser has the ability to shape the minds of consumers towards a positive recognition of a brand, which is essential for sellers seeking to stand out in an oversaturated

market (p. 221). In another study, Khan and Zaman (2021) conducted a study examining the association between the use of celebrity endorsers and consumer brand trust in the context of high-end luxury brands. This study found the use of celebrity endorsement can foster a higher amount of brand trust among consumers, which in turn is positive for the brands, as consumers will be more likely to provide marketing feedback to brands they are trusting of (p. 600). In this study's discussion, researchers endorsed the possibility that the reasoning for celebrity endorsements being so effective for garnering brand trust could be due to the fact that consumers tend to associate certain brands with celebrities they see often, thus causing consumers to feel more at ease with these brands due to their familiarity with the endorser (Khan and Zaman, 2021).

A second key aspect of this study is examining whether an association exists between the use of celebrity endorsements and purchase intentions. Yue and Colleagues (2023) published a study examining how parasocial relationships followers form with celebrity endorsers can foster positive emotions associated with a certain brand. Furthermore, researchers discussed how these emotions can thus tap into a consumer's impulsive urges, specifically the urge to complete impulsive purchases (p. 350). Understanding the link between relationships with a celebrity and impulse purchasing are imperative for researchers to understand in order to achieve good standing in the market through ensuring that consumers will choose to buy their product first, rather than their competitors. The results of another study on the connection between the utilization of celebrity endorsers and purchase intention by Osei-Frimpong and Colleagues (2019) implies that "celebrity endorsements taking into account the endorser's level of familiarity, attractiveness, and trustworthiness have a positive influence on consumer behavior" (p. 112). These findings imply that celebrity endorsers are an extremely effective tool for brands

to efficiently foster stronger emotional connection with their consumers, thus boosting consumers' purchase intentions. Additionally, a study by Pradhan and Colleagues (2016) examines how personality congruence between consumers and celebrity endorsers affects purchase intentions. Results found a significant relationship between how a brand's personality is thus shaped by the personality of a celebrity endorsement, which (given that the celebrity provides a positive personality association), has an intensely positive result on boosting purchase intentions (p. 467).

Based on the aforementioned literature, researchers formulated the following hypotheses:

H1: Consumers are more likely to trust brands that are endorsed by celebrities.

H2: Consumers are more likely to purchase from brands endorsed by celebrities.

Methods

Sample

A survey was presented to test an association between celebrity endorsement, brand trust, and purchase intention. The presented study's target population consisted of students at University of California, Santa Barbara. The sampling frame was then refined to only include students currently enrolled in Communication 88. A convenience sampling technique was utilized through the use of an online forum on Canvas in which students voluntarily completed the survey for class credit. A total of 46 responses were collected. The participants were asked to provide demographic information on their gender and age. Among the participants, 17 were male (37%) and 29 were female (63%). Additionally, 1 participant was 18 years old (2.2%), 16 participants were 19 years old (34.8%), 20 participants were 20 years old (43.5%), and 9 participants were 21 years old or older (19.6%).

Procedure

This study was conducted in the form of a questionnaire created through Google Forms. The survey began with a consent form in which participants were told that their responses would be kept anonymous and that participation in this study was completely voluntary. If participants consented to participate in the study, they would be prompted to the next section. If they did not, they would be taken to the end of the survey. Given participants consented, they would be asked questions about their demographics including gender and age, along with a few other pre-survey questions on their current opinions on brands utilizing celebrity endorsements as a form of advertising. Participants were then led to the "Advertisements" section (see more under "Stimulus Materials"), in which they were prompted to view two advertisements each for five brands and rate their perceived brand trust and purchase intention based on each advertisement.

Stimulus Materials

This study's "Advertisements" section consisted of a manipulated independent variable (IV) which consisted of the two types of ads a participant was exposed to: one ad featuring an endorsement by a celebrity, and one ad without endorsement from a celebrity per brand. Participants were not split into groups, but rather prompted to view both advertisements of a particular product for each of the five brands, answering the corresponding questions following each advertisement. Participants were asked to disregard the cost of an item when answering the questions to reduce outside factors when selecting their purchase intention based on an advertisement.

Dependent Measurements

Brand Trust

The dependent variable, brand trust, was operationalized using a single item scale created by the researchers. This item was measured using a 5-point Likert scale (*1 = I would not rate*

this brand as trustworthy at all and 5 = I would trust this brand completely) in response to the question: "Watch [the following advertisement] for [the following brand], then rate how much you trust the brand based off this advertisement."

Purchase Intention

The dependent variable, purchase intention, was operationalized using a single item scale created by the researchers. This item was also measured using a 5-point Likert scale (*1 = I would never consider purchasing from this brand and 5 = I would definitely purchase from this brand)* in response to the question: "Watch [the following advertisement] for [the following brand], then rate how much your likelihood to purchase from this brand based off this advertisement."

Results

For this particular analysis, only the results of Brand 3, UberEats, will be included in the results section due to this advertisement having the highest level of celebrity (Simone Biles) endorsement recognition from survey takers.

H1 predicted that consumers would be more likely to rate a brand's perceived trust as higher when an advertisement featured a celebrity endorsement. Upon analyzing the data using a composite measure of averaged items, this hypothesis was supported. The reported brand trust for the advertisement featuring celebrity endorsements (M = 3.48), was higher than that without a celebrity endorsement (M = 3.2).

H2 predicted that consumers would be more likely to purchase from a brand when an advertisement featured a celebrity endorsement. Upon using a composite measure of averaged items to complete a data analysis, this hypothesis was supported. The reported brand purchase intention for an advertisement featuring a celebrity endorsement (M = 3.63), was higher than that without a celebrity endorsement (M = 3.13). See appendix for calculations.

Discussion

The main objective of the present study was to determine whether an association between celebrity endorsements, brand trust, and purchase intention exists. H1 states that consumers are more likely to trust brands that are endorsed by celebrities, which was supported by the results. These results are consistent with previous research which provided the basis for H1. The study by Khan and Saman (2021) found that “celebrities' widespread use is their ability to improve customers' perceptions of a product” (p. 601), providing support to the idea that utilizing celebrity endorsements is consistent with improving a brand’s trustworthiness in the eyes of its consumers. Additionally, the results of Febrian and Fadly’s (2021) study on the impact of celebrity endorsements on brand attitudes support the conclusion that the effects of celebrity endorsements can strongly influence brand attitudes, including the overall trust of a brand (p. 214). The findings of Chaudhuri and Holbrook’s (2001) study supported the conclusion that brand equity is almost entirely dependent on a consumers’ emotional association with a brand (p. 90). Thus, celebrity endorsements are proven to be an extremely effective tool in enhancing consumers’ brand attitudes and associations, which is consistent with boosting brand trust.

H2 states that consumers are more likely to purchase from brands endorsed by celebrities, which was additionally supported by the results of this study. These results are consistent with the literature which provided the basis for H2. Results of Yue and Colleagues (2023) study presented a strong link between “parasocial relationship [between celebrities and consumers]–emotions link toward the endorsement–behavior connection” (p. 351). These findings present important insights into the phenomenon of celebrity endorsement and its positive association with consumer purchase intentions. Another study by Osei-Frimpong and Colleagues (2019) provided results which stated that celebrity endorsement use has a positive association with

purchase intention, adding additional information that this point is only valid if said celebrity endorser is seen as attractive in looks and personality to their audience (p. 115). Results from Pradhan and Colleagues' (2016) study provided insights into how if a proper celebrity endorser is chosen for a brand (ie. given that their attitude and image is generally consistent with the consumer audience), purchase intention will be significantly inflated (p. 467). Given the aforementioned results of both the presented study and literature review, these findings support the idea that the use of celebrity endorsements is a key aspect for brands to consider when considering their upcoming marketing strategies. The ability of celebrity endorsements to boost purchase intentions is imperative for brands to ensure that their product is able to stay on top of their competitors in the market, along with garnering sales and consumer support in general.

While the results of this study appear to be in line with the previous research presented, there are several limitations present in this study that are worthy of note. One major weakness of this study was the limited sampling abilities. For one, this sample consisted only of current Comm 88 students at the University of California, Santa Barbara. In addition to this already limited sample, only 46 out of 233 enrolled students opted to participate in this particular study, making for an extremely restricted scope. This study also utilized convenience sampling, which further limited the sample's representativeness. Due to this, this study would not be considered to have high levels of external validity, making it difficult to support claims generalizable to a population. To improve this, further researchers may consider utilizing a larger and more geographically diverse sample through the use of a stratified sampling technique. As this study sought to accurately measure the opinions of students at the University of California, Santa Barbara, it may prove helpful to divide students into subsections based on characteristics such as age, academic year, major, or gender. From there, a quota can be met through randomly selecting participants from each group and asking them to fill out the presented survey. Through this, not

only would researchers be able to have more control over the size of the sample presented (ability to reach out to more students rather than relying on students to choose one specific questionnaire on Canvas), but also procure a more representative sample, which would make the survey results more statistically significant.

Another limitation present in this study is the lack of separating participants into control and experimental conditions. While the survey had these conditions present, utilizing both ads with celebrity endorsements and those without, researchers failed to actually separate participants into these groups, rather having participants answer both conditions. The results of this survey could have benefitted from this separation as this would increase the study's internal validity due to possible confounding variables that came with watching both advertisements, such as bias toward celebrity endorsed ads due to feeling like that's what they were "meant" to do or lean toward the non-celebrity endorsed ad due to recency bias in the survey order. Future researchers may want to ensure the separation of control and experimental conditions, perhaps even utilizing an experimental format rather than a survey format.

Additionally, possible confounding variables were found within the advertisements chosen for participants to watch. Due to the setup of Google Forms, researchers were limited to only advertisements posted to the site "YouTube." Due to this, there were less options to choose from in terms of ads. In the examined advertisement, Brand 3 for UberEats, the celebrity endorsed ad was 15 seconds long, whereas the non-celebrity endorsed ad was 30 seconds long. This could decrease the study's internal validity, as participants may have a bias toward a longer or shorter advertisement. To provide advice to future researchers, it should be suggested that advertisements should be as consistent as possible to keep internal validity, including the advertisement's length, genre, setting, and presented product.

Survey

RELEVANCE Project

Hello! Welcome to the Relevance Project! In this survey, you will be asked to watch a series of advertisements for different brands and rate them on a series of scales 1-5.

m_keller@ucsb.edu Switch account

* Indicates required question

Consent Form

This is a study by Kiara Edwards-Lopez, Zoe Wilson, Boomika Velineni, Sophia de Gast, and Mackenzie Keller, about advertisements for different brands. You will be asked questions about your opinion based on the brand from a different celebrity endorsement.

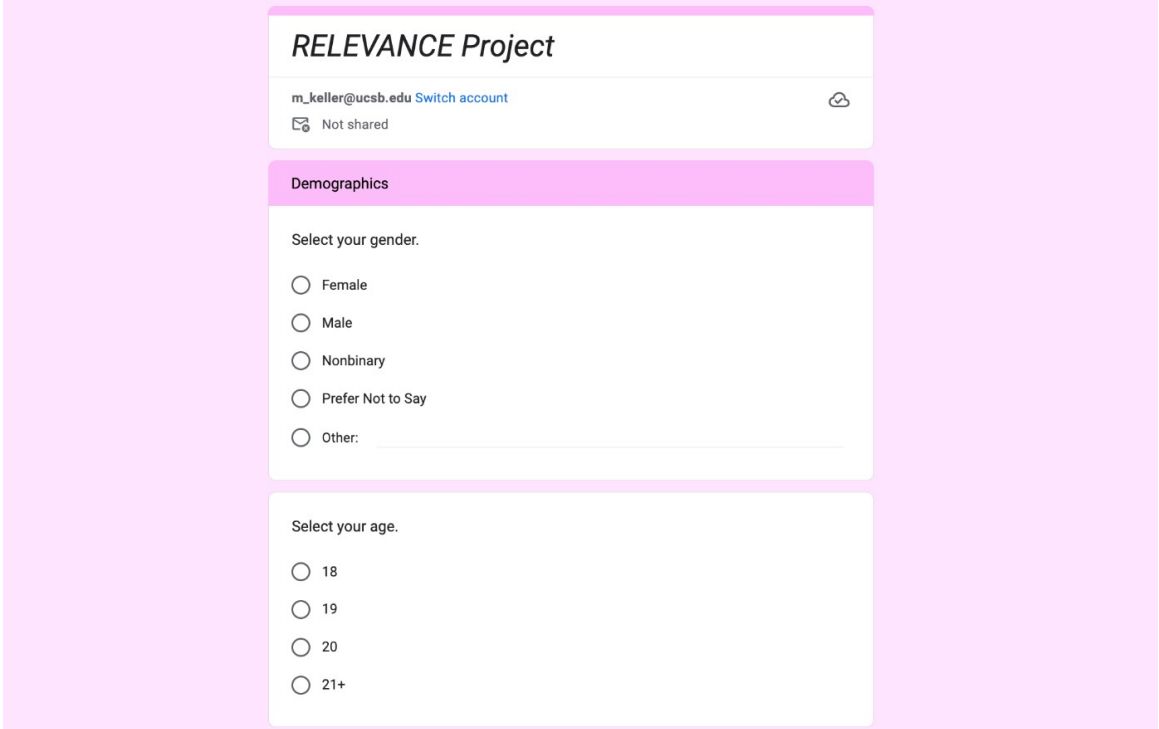

Your responses are completely anonymous (i.e. your name is not being collected so your responses cannot be connected to you in any way). The data you provide will only be used for class demonstrations. *

This study is also completely voluntary. You may skip any question you do not feel comfortable answering, or you may decide not to participate at all.

If you consent to participate in this study, please click forward to the next page by answering yes.

Advertisements:
You will be prompted to watch 2 advertisements per brand. Then answer the questions corresponding to each advertisement. We understand that not all brands will necessarily fit everyones taste, but please keep in mind this is a test of the advertisement and it's effect on your opinion of the brand. While not every brand might be one you would purchase from regularly, please keep an open mind and focus your answers to the questions on the advertisements only.

Brand 1:
Advertisement A:

Brand 1:
Advertisement A:
Features NFL player Joe Burrow. Rate how much you *trust* this celebrity.

- ◯ 0: I do not know who this celebrity is.

Survey Debrief

Thank you for participating in our survey on *How Celebrity Endorsements Impact Brand Trustworthiness and Purchase Intentions*. Your responses help us understand how celebrity partnerships shape consumer trust and influence buying decisions.

This study explores two key areas:

- **Brand Trustworthiness:** How celebrity endorsements affect trust in a brand, based on the celebrity's reputation and endorsement relevance.
- **Purchase Intentions:** The impact of endorsements on consumers' likelihood to buy, considering product type and demographic influences.

We appreciate your time and input, which will guide further research into consumer behavior and marketing strategies.
